ELECTRICAL TIPS: WIRING A PLUG

Cut away the plastic insulation to expose about 0.5cm of the three wires, gently twist the copper strands together and fold them over.

Remove the plug cover and unscrew the little screws on each pin of the plug and insert the twisted copper wire of the plug's pins into the holes in the pins.

Always insert the green/yellow wire into the top pin, the blue wire (neutral) into the left pin and the brown wire (live) into the right pin.

Make sure that the electrical cord is in place and firmly gripped by the arrestor clips. Replace the cover of the plug.
